Unit Circle

Where the angle is usually represented as $\theta$, $\varphi$, or $\delta$

Conversions

Cartesian coordinates to polar coordinates

$$x = r \cdot \cos(\varphi)$$
$$y = r \cdot \sin(\varphi)$$

Polar coordinates to Cartesian coordinates

$$r = \sqrt{x^2 + y^2}$$
$$\tan(\varphi) = \frac{y}{x}, \quad x \neq 0$$

Visual representation of polar and Cartesian relationships, Pythagorean Theorem, and application in physics.

$$E = \sqrt{(pc)^2 + (mc^2)^2}$$
$$r = \sqrt{x^2 + y^2}$$
